| Assays for the activation of         | transcription through the Signal | Fransducers and Activators of | Transcription (STAT6) response          | element in immune cells (such as in  | the human HMC-1 mast cell line) are | well-known in the art and may be | used or routinely modified to assess  | the ability of polypeptides of the | invention (including antibodies and | agonists or antagonists of the | invention) to regulate STAT6 | transcription factors and modulate | the expression of multiple genes. | Exemplary assays for transcription   | through the STAT6 response element | that may be used or routinely         | modified to test STAT6 response  | element activity of the polypeptides | of the invention (including antibodies | and agonists or antagonists of the  | invention) include assays disclosed in | Berger et al., Gene 66:1-10 (1998); | Cullen and Malm, Methods in        | Enzymol 216:362-368 (1992);       | Henthorn et al., Proc Natl Acad Sci | USA 85:6342-6346 (1988); Sherman, | Immunol Rev 179:48-56 (2001);   | Malaviya and Uckun, J Immunol        | 168:421-426 (2002); Masuda et al., J | Biol Chem 275(38):29331-29337 | 2000); and Masuda et al., J Biol    | Chem 276:26107-26113 (2001), the    | contents of each of which are herein | incorporated by reference in its | entirety. Mast cells that may be used | according to these assays are publicly |

| blood vessel blooks as heart disease | otoou reset monage, near mease,     | stroke, impotence (e.g., due to     | diabetic neuropathy or blood vessel | blockage), seizures, mental           | confusion, drowsiness, nonketotic    | hyperglycemic-hyperosmolar coma, | cardiovascular disease (e.g., heart | disease, atherosclerosis,             | microvascular disease, hypertension,  | stroke, and other diseases and       | disorders as described in the      | "Cardiovascular Disorders" section | below), dyslipidemia, endocrine   | disorders (as described in the      | "Endocrine Disorders" section       | below), neuropathy, vision          | impairment (e.g., diabetic retinopathy | and blindness), ulcers and impaired | wound healing, and infection (e.g., | infectious diseases and disorders as | described in the "Infectious  | Diseases" section below, especially | of the urinary tract and skin), carpal | tunnel syndrome and Dupuytren's      | contracture). An additional        | highly preferred indication is obesity | and/or complications associated with | obesity. Additional highly preferred | indications include weight loss or | alternatively, weight gain. Additional | highly preferred indications are   | complications associated with insulin | resistance.                       |                                 |                                    |                                   |                                 |
| bue soliton/aniotom metalia ha vale  | also of certain process peaces, and | disregulation is a key component in | diabetes. Exemplary assays that may | be used or routinely modified to test | for stimulation of insulin secretion | (from pancreatic cells) by       | polypeptides of the invention       | (including antibodics and agonists or | antagonists of the invention) include | assays disclosed in: Shimizu, H., et | al., Endocr J, 47(3):261-9 (2000); | Salapatck, A.M., ct al., Mol       | Endocrinol, 13(8):1305-17 (1999); | Filipsson, K., et al., Ann N Y Acad | Sci, 865:441-4 (1998); Olson, L.K., | et al., J Biol Chem, 271(28):16544- | 52 (1996); and, Miraglia S ct. al.,    | Journal of Biomolecular Screening,  | 4:193-204 (1999), the contents of   | each of which is herein incorporated | by reference in its entirety. | Pancreatic cells that may be used   | according to these assays are publicly | available (e.g., through the ATCCTM) | and/or may be routinely generated. | Exemplary pancreatic cells that may    | be used according to these assays    | include HITT15 Cells. HITT15 are     | an adherent epithelial cell line   | established from Syrian hamster islet  | cells transformed with SV40. These | cells express glucagon, somatostatin, | and glucocorticoid receptors. The | cells secrete insulin, which is | stimulated by glucose and glucagon | and suppressed by somatostatin or | glucocorticoids. ATTC# CRL-1777 |

|  | stroke, and other diseases and          |
|--|-----------------------------------------|
|  | disorders as described in the           |
|  | "Cardiovascular Disorders" section      |
|  | below), dyslipidemia, endocrine         |
|  | disorders (as described in the          |
|  | "Endocrine Disorders" section           |
|  | below), neuropathy, vision              |
|  | impairment (e.g., diabetic retinopathy  |
|  | and blindness), ulcers and impaired     |
|  | wound healing, infection (e.g.,         |
|  | infectious diseases and disorders as    |
|  | described in the "Infectious            |
|  | Diseases" section below (particularly   |
|  | of the urinary tract and skin). An      |
|  | additional highly preferred indication  |
|  | is obesity and/or complications         |
|  | associated with obesity. Additional     |
|  | highly preferred indications include    |
|  | weight loss or alternatively, weight    |
|  | gain. Additional highly                 |
|  | preferred indications are               |
|  | complications associated with insulin   |
|  | resistance. Additional highly           |
|  | preferred indications are disorders of  |
|  | the musculoskeletal systems             |
|  | including myopathies, muscular          |
|  | ξ,                                      |
|  | herein. Additional highly               |
|  | preferred indications include,          |
|  | hypertension, coronary artery           |
|  | disease, dyslipidemia, gallstones,      |
|  | osteoarthritis, degenerative arthritis, |
|  | eating disorders, fibrosis, cachexia,   |
|  | and kidney diseases or disorders.       |
|  | Preferred indications include           |
|  | neoplasms and cancer, such as,          |
|  | lymphoma, leukemia and breast,          |

| colon, and kidney emeer. Additional perferred indications include melanoma, prostate, lung metaretti, colonical series discussions in the protection, cospolage al, someth, liver, and trimary cancer. Highly preferred indications include lipomas and jitosateomas. Other preferred indications include benign dependent of the proposition of the proposition of the proposition of the propositions, such as, for example, hyporalisas, metaplisas, and and or dysplasia. | A highly preferred emboliment<br>of the invention includes a method<br>of seaminaing the production of<br>GM-CSE. An alternative highly<br>perferred emboliment of the<br>invention includes a method for<br>including the production of GM-<br>cSE. NK cells show anthody-independent killing of tumor cells and slas recognize authody bound on target cells, via NK Fe receptors, leading to cell-mediated cytotoxicity.                                                                                                                                                                                                                                                                     |

| secretion is measured by FMAT      | using anti-rat insulin antibodies.   | Insulin secretion from pancreatic beta | cells is upregulated by glucose and | also by certain proteins/peptides, and | disregulation is a key component in | diabetes. Exemplary assays that may    | be used or routinely modified to test | for stimulation of insulin secretion | (from pancreatic cells) by       | polypeptides of the invention       | (including antibodies and agonists or | antagonists of the invention) include  | assays disclosed in: Ahren, B., et al., | Am J Physiol, 277(4 Pt 2):R959-66 | (1999); Li, M., et al., Endocrinology, | 138(9):3735-40 (1997); Kim, K.H., | et al., FEBS Lett, 377(2):237-9 | (1995); and, Miraglia S ct. al., | Journal of Biomolecular Screening, | 4:193-204 (1999), the contents of | each of which is herein incorporated | by reference in its entirety.       | Pancreatic cells that may be used    | according to these assays are publicly | available (e.g., through the ATCCTM) | and/or may be routinely generated. | Exemplary pancreatic cells that may | be used according to these assays | include rat INS-1 cells. INS-1 cells   | are a semi-adherent cell line | established from cells isolated from | an X-ray induced rat transplantable | insulinoma. These cells retain | characteristics typical of native | pancreatic beta cells including | glucose inducible insulin secretion, |

|  |  | disorders (as described in the          |
|  |  | "Endocrine Disorders" section           |
|  |  | below), neuropathy, vision              |
|  |  | impairment (e.g., diabetic retinopathy  |
|  |  | and blindness), ulcers and impaired     |
|  |  | wound healing, infection (e.g.,         |
|  |  | infectious diseases and disorders as    |
|  |  | described in the "Infectious            |
|  |  | Diseases" section below, especially     |
|  |  | of the urinary tract and skin), carpal  |
|  |  | tunnel syndrome and Dupuytren's         |
|  |  | contracture). An additional highly      |
|  |  | preferred indication is obesity and/or  |
|  |  | complications associated with           |
|  |  | obesity. Additional highly preferred    |
|  |  | indications include weight loss or      |
|  |  | alternatively, weight gain.             |
|  |  | Additional highly preferred             |
|  |  | indications are complications           |
|  |  | associated with insulin resistance.     |
|  |  | Additional highly preferred             |
|  |  | indications are disorders of the        |
|  |  | musculoskeletal systems including       |
|  |  | myopathies, muscular dystrophy,         |
|  |  | and/or as described herein.             |
|  |  | Additional highly preferred             |
|  |  | indications include, hepatitis,         |
|  |  | jaundice, gallstones, cirrhosis of the  |
|  |  | liver, degenerative or necrotic liver   |
|  |  | disease, alcoholic liver diseases,      |
|  |  | fibrosis, liver regeneration, metabolic |
|  |  | disease, dyslipidemia and               |
|  |  | chlolesterol metabolism.                |
|  |  | Additional highly preferred             |
|  |  | indications include neoplasms and       |

| caneers, girls as legatocarcitonus, other liver ensers, and other and paracentic cancer. Preferred indications also include prostate, breast, ling, esophageal, sommeth, ment, and timing vaneer. Other preferred indications include beinging preferred indications include beinging oppositions include beinging oppositions and pre-trend indications include beinging and example, by specifications, and pre-trend indications and pre-trend indications, and pre-trend indications, and pre-trend indications, and pre-trend indications, and pre-trend indications, and pre-trend indications, and pre-trend indications, and pre-trend indications. | d thighty preferred indexions is a children were than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the another than the |

An alternative highly preferred and receasing muscle cell survival. A preferred muscle cell politication. In an accompanient, selected muscle cell politication, in a specific embodiment of the invention includes a method for simulating muscle cell politication, in a specific embodiment, selected muscle politication is simulated. An alternative highly preferred and politication, in a specific embodiment, selected muscle cell prolitication, in a specific embodiment, selected muscle cell prolitication; in any septic embodiment, selected muscle cell prolitication; in any standard general embodiment of the invention includes a method for alternative muscle cell differentiation is a minimating muscle cell differentiation is eliminated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| of the vessels themselves, such as of | the arteries, capillaries, veins and/or | lymphatics). Highly preferred are | indications that stimulate | angiogenesis and/or | cardiovascularization. Highly | preferred are indications that inhibit | angiogenesis and/or | cardiovascularization. Highly | preferred indications include | antiangiogenic activity to treat solid | tumors, leukemias, and Kaposi"s | sarcoma, and retinal disorders. | Highly preferred indications include | neoplasms and cancer, such as, | Kaposi"s sarcoma, hemangioma | (capillary and cavernous), glomus | tumors, telangiectasia, bacillary | angiomatosis, | hemangioendothelioma, | angiosarcoma, | haemangiopericytoma, | lymphangioma, lymphangiosarcoma. | Highly preferred indications also | include cancers such as, prostate, | breast, lung, colon, pancreatic, | esophageal, stomach, brain, liver, | and urinary cancer. Preferred | indications include benign | dysproliferative disorders and pre- | neoplastic conditions, such as, for | example, hyperplasia, metaplasia, | and/or dysplasia. Highly | preferred indications also include | arterial disease, such as, | atherosclerosis, hypertension, |

| nathway CREB plays a major role in | adinocenesis and is involved in  | differentiation into adipocytes. CRE  | contains the binding sequence for the | transcription factor CREB (CRE      | binding protein). Exemplary assays | for transcription through the cAMP | response element that may be used or | routinely modified to test cAMP-    | response element activity of | polypeptides of the invention        | (including antibodies and agonists or | antagonists of the invention) include | assays disclosed in Berger et al., | Gene 66:1-10 (1998); Cullen and | Malm, Methods in Enzymol       | 216:362-368 (1992); Henthorn et al., | Proc Natl Acad Sci USA 85:6342- | 6346 (1988); Reusch et al., Mol Cell   | Biol 20(3):1008-1020 (2000); and    | Klemm et al., J Biol Chem 273:917-  | 923 (1998), the contents of each of  | which are herein incorporated by | reference in its entirety. Pre-     | adipocytes that may be used            | according to these assays are publicly | available (e.g., through the ATCCTM) | and/or may be routinely generated. | Exemplary mouse adipocyte cells       | that may be used according to these | assays include 3T3-L1 cells. 3T3-L1 | is an adherent mouse preadipocyte | cell line that is a continuous substrain | of 3T3 fibroblast cells developed | through clonal isolation and undergo | a pre-adipocyte to adipose-like | conversion under appropriate |
|                                    |                                  |                                       |                                       |                                     |                                    |                                    |                                      |                                     |                              |                                      |                                       |                                       |                                    |                                 |                                |                                      |                                 |                                        |                                     |                                     |                                      |                                  |                                     |                                        |                                        |                                      |                                    |                                       |                                     |                                     |                                   |                                          |                                   |                                      |                                 |                              |
|                                    |                                  |                                       |                                       |                                     |                                    |                                    |                                      |                                     |                              |                                      |                                       |                                       |                                    |                                 |                                |                                      |                                 |                                        |                                     |                                     |                                      |                                  |                                     |                                        |                                        |                                      |                                    |                                       |                                     |                                     |                                   |                                          |                                   |                                      |                                 |                              |

|                                                 | A highly preferred indication is | diabetes mellitus. An             | additional highly preferred indication | is a complication associated with    | diabetes (e.g., diabetic retinopathy, | diabetic nephropathy, kidney disease | (e.g., renal failure, nephropathy |                                         | described in the "Renal Disorders" | section below), diabetic neuropathy, | nerve disease and nerve damage | (e.g., due to diabetic neuropathy), | blood vessel blockage, heart disease, | stroke, impotence (e.g., due to | _                                   | blockage), seizures, mental    | confusion, drowsiness, nonketotic  | hyperglycemic-hyperosmolar coma, | cardiovascular disease (e.g., heart  | disease, atherosclerosis,          | microvascular disease, hypertension, | stroke, and other diseases and      | disorders as described in the       | "Cardiovascular Disorders" section | below), dyslipidemia, endocrine     | disorders (as described in the  | "Endocrine Disorders" section      | below), neuropathy, vision      | impairment (e.g., diabetic retinopathy | and blindness), ulcers and impaired | wound healing, and infection (e.g., | infectious diseases and disorders as | described in the "Infectious | Diseases" section below, especially  | of the urinary tract and skin), carpal |

| secretion is measured by FMAT using anti-rat insulin antibodies.        | Insulin secretion from pancreatic beta | cells is upregulated by glucose and | also by certain proteins/peptides, and | disregulation is a key component in | diabetes. Exemplary assays that may | be used or routinely modified to test | for stimulation of insulin secretion | (from pancreatic cells) by       | polypeptides of the invention       | (including antibodies and agonists or | antagonists of the invention) include | assays disclosed in: Ahren, B., et al., | Am J Physiol, 277(4 Pt 2):R959-66 | (1999); Li, M., et al., Endocrinology, | 138(9):3735-40 (1997); Kim, K.H., | et al., FEBS Lett, 377(2):237-9 | (1995); and, Miraglia S et. al., | Journal of Biomolecular Screening, | 4:193-204 (1999), the contents of      | each of which is herein incorporated | by reference in its entirety.       | Pancreatic cells that may be used    | according to these assays are publicly | available (e.g., through the ATCCTM) | and/or may be routinely generated.     | Exemplary pancreatic cells that may | be used according to these assays | include rat INS-1 cells. INS-1 cells   | are a semi-adherent cell line        | established from cells isolated from | an X-ray induced rat transplantable | insulinoma. These cells retain | characteristics typical of native | pancreatic beta cells including | glucose inducible insulin secretion. |
|                                                                         |                                        |                                     |                                        |                                     |                                     |                                       |                                      |                                  |                                     |                                       |                                       |                                         |                                   |                                        |                                   |                                 |                                  |                                    |                                        |                                      |                                     |                                      |                                        |                                      |                                        |                                     |                                   |                                        |                                      |                                      |                                     |                                |                                   |                                 |                                      |

|  |   | preferred indications include          |
|--|---|----------------------------------------|
|  |   | antiangiogenic activity to treat solid |
|  |   | tumors, leukemias, and Kaposi"s        |
|  |   | sarcoma, and retinal disorders.        |
|  |   | Highly preferred indications include   |
|  |   | neoplasms and cancer, such as,         |
|  |   | Kaposi"s sarcoma, hemangioma           |
|  |   | (capillary and cavernous), glomus      |
|  |   | tumors, telangiectasia, bacillary      |
|  |   | angiomatosis,                          |
|  |   | hemangioendothelioma,                  |
|  | _ | angiosarcoma,                          |
|  | _ | haemangiopericytoma,                   |
|  | _ | lymphangioma, lymphangiosarcoma.       |
|  |   | Highly preferred indications also      |
|  |   | include cancers such as, prostate,     |
|  | _ | breast, lung, colon, pancreatic,       |
|  |   | esophageal, stomach, brain, liver,     |
|  |   | and urinary cancer. Preferred          |
|  |   | indications include benign             |
|  |   | dysproliferative disorders and pre-    |
|  | _ | neoplastic conditions, such as, for    |
|  |   | example, hyperplasia, metaplasia,      |
|  |   | and/or dysplasia. Highly               |
|  |   | preferred indications also include     |
|  | _ | arterial disease, such as,             |
|  |   | atherosclerosis, hypertension,         |
|  | _ | coronary artery disease,               |
|  |   | inflammatory vasculitides,             |
|  |   | Reynaud"s disease and Reynaud"s        |
|  |   | phenomenom, aneurysms, restenosis;     |
|  |   | venous and lymphatic disorders such    |
|  | _ | as thrombophlebitis, lymphangitis,     |
|  | _ | and lymphedema; and other vascular     |
|  |   |                                        |
|  |   | disease, and cancer. Highly            |
|  |   | preferred indications also include     |

| trauma such as wounds, burns, and | injured tissue (e.g., vascular injury | such as, injury resulting from balloon | angioplasty, and atheroschlerotic | esions), implant fixation, scarring, | schemia reperfusion injury, | rheumatoid arthritis, cerebrovascular | disease, renal diseases such as acute | renal failure, and ostcoporosis. | Additional highly preferred | indications include stroke, graft | rejection, diabetic or other | retinopathies, thrombotic and | coagulative disorders, vascularitis, | lymph angiogenesis, sexual | disorders, age-related macular | degeneration, and treatment | prevention of endometriosis and | related conditions. Additional highly | preferred indications include | fibromas, heart disease, cardiac | dis    | vascular disease. Preferred | indications include blood disorders | (e.g., as described below under | "Immune Activity", "Blood-Related | Disorders", and/or "Cardiovascular | Disorders"). Preferred indications | include autoimmune diseases (e.g., | rheumatoid arthritis, systemic lupus | erythematosis, multiple sclerosis | and/or as described below) and | immunodeficiencies (e.g., as | described below). Additional | preferred indications include | inflammation and inflammatory<br>disorders (such as acute and chronic |

                                                                                                                                                                                                                                                                                                                                         |

|  | below), dyslipidemia, endocrine         |
|--|-----------------------------------------|
|  | disorders (as described in the          |
|  | "Endocrine Disorders" section           |
|  | below), neuropathy, vision              |
|  | impairment (e.g., diabetic retinopathy  |
|  | and blindness), ulcers and impaired     |
|  | wound healing, infection (e.g.,         |
|  | infectious diseases and disorders as    |
|  | described in the "Infectious            |
|  | Diseases" section below (particularly   |
|  | of the urinary tract and skin). An      |
|  | additional highly preferred indication  |
|  | is obesity and/or complications         |
|  | associated with obesity. Additional     |
|  | highly preferred indications include    |
|  | weight loss or alternatively, weight    |
|  | gain. Additional highly                 |
|  | preferred indications are               |
|  | complications associated with insulin   |
|  | resistance. Additional highly           |
|  | preferred indications are disorders of  |
|  | the musculoskeletal systems             |
|  | including myopathies, muscular          |
|  | dystrophy, and/or as described          |
|  | herein. Additional highly               |
|  | preferred indications include,          |
|  | hypertension, coronary artery           |
|  | disease, dyslipidemia, gallstones,      |
|  | osteoarthritis, degenerative arthritis, |
|  | eating disorders, fibrosis, cachexia,   |
|  | and kidney diseases or disorders.       |
|  | Preferred indications include           |
|  | neoplasms and cancer, such as,          |
|  | lymphoma, leukemia and breast,          |
|  | colon, and kidney cancer. Additional    |
|  | preferred indications include           |
|  | melanoma, prostate, lung,               |

| invention (including antibodies and agonists or antagonists of the    | invention) include assays disclosed in | Berger et al., Gene 66:1-10 (1998); | Cullen and Malm, Methods in          | Enzymol 216:362-368 (1992);    | Henthorn et al., Proc Natl Acad Sci | USA 85:6342-6346 (1988);           | Lochhead et al., Diabetes 49(6):896- | 903 (2000); and Yeagley et al., J Biol | Chem 275(23):17814-17820 (2000), | the contents of each of which is | herein incorporated by reference in    | its entirety. Hepatocyte cells that | may be used according to these     | assays are publicly available (e.g., | through the ATCCTM) and/or may be | routinely generated. Exemplary liver | hepatoma cells that may be used        | according to these assays include | H4lle cells, which contain a tyrosine | amino transferase that is inducible    | with glucocorticoids, insulin, or    | cAMP derivatives.                    |                                    |                             |                             |                               |                                     |                             |                                  |                                   |                                 |                             |                             |                                      |                               |
|                                                                       |                                        |                                     |                                      |                                |                                     |                                    |                                      |                                        |                                  |                                  |                                        |                                     |                                    |                                      |                                   |                                      |                                        |                                   |                                       |                                        |                                      |                                      |                                    |                             |                             |                               |                                     |                             |                                  |                                   |                                 |                             |                             |                                      |                               |

| Highly preferred indications include | allergy, asthma, and rhinitis.   | Additional preferred indications | include infection (e.g., an infectious | disease as described below under      | "Infectious Disease"), and       | inflammation and inflammatory   | disorders. Preferred indications also | include blood disorders (e.g., as | described below under "Immune     | Activity", "Blood-Related    | Disorders", and/or "Cardiovascular | Disorders"). Preferred indications | include autoimmune diseases (e.g.,    | rheumatoid arthritis, systemic lupus | erythematosis, multiple sclerosis   | and/or as described below) and   | immunodeficiencies (e.g., as | described below). Preferred     | indications include neoplastic | diseases (e.g., leukemia, lymphoma,  | melanoma, prostate, breast, lung, | colon, pancreatic, esophageal, | stomach, brain, liver, and urinary | tract cancers and/or as described     | below under "Hyperproliferative       | Disorders"). Other preferred       | indications include benign      | dysproliferative disorders and pre- | neoplastic conditions, such as, for  | example, hyperplasia, metaplasia, | and/or dysplasia. Preferred        | indications include anemia,        | pancytopenia, leukopenia,     | thrombocytopenia, leukemias, | Hodgkin's disease, acute         | lymphocytic anemia (ALL),        |

| This reporter assay measures         | activation of the NFAT signaling | pathway in HMC-1 human mast cell | line. Activation of NFAT in mast       | cells has been linked to cytokine and | chemokine production. Assays for | the activation of transcription | through the Nuclear Factor of         | Activated T cells (NFAT) response | element are well-known in the art | and may be used or routinely | modified to assess the ability of  | polypeptides of the invention      | (including antibodies and agonists or | antagonists of the invention) to     | regulate NFAT transcription factors | and modulate expression of genes | involved in immunomodulatory | functions. Exemplary assays for | transcription through the NFAT | response element that may be used or | routinely modified to test NFAT-  | response element activity of   | polypeptides of the invention      | (including antibodies and agonists or | antagonists of the invention) include | assays disclosed in Berger et al., | Gene 66:1-10 (1998); Cullen and | Malm, Methods in Enzymol            | 216:362-368 (1992); Henthorn et al., | Proc Natl Acad Sci USA 85:6342-   | 6346 (1988); De Boer et al., Int J | Biochem Cell Biol 31(10):1221-1236 | (1999); Ali et al., J Immunol | 165(12):7215-7223 (2000);    | Hutchinson and McCloskey, J Biol | Chem 270(27):16333-16338 (1995), |
| Activation of                        | transcription through            | NFAT response                    | element in immune                      | cells (such as mast                   | cells).                          |                                 |                                       |                                   |                                   |                              |                                    |                                    |                                       |                                      |                                     |                                  |                              |                                 |                                |                                      |                                   |                                |                                    |                                       |                                       |                                    |                                 |                                     |                                      |                                   |                                    |                                    |                               |                              |                                  |                                  |

Rat myoblast cells that may be used according to these assays are publicly available (e.g., through the     | ALCL <sup>18</sup> ). Exemplary rat myoblast cells that may be used according to these assays include L6 cells. L6 is an adherent rat myoblast cell line, | isolated from primary cultures of rat<br>thigh muscle, that fuses to form<br>multinucleated myotubes and striated | nbers after culture in differentiation<br>media.                                                        |                                                                                                                                          |                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                             |

Teaching to these season in the may be used according to these seasy includes the mouse 713-L1 cell line. 373-L1 is a mouse the mode of the cell line. 373-L1 is a mouse in eachipoyee de line (adherent). It is a continuous substrain of 3713 filt having a general mouse and in the cell line (adherent). It is a continuous substrain of 3713 filt having a continuous substrain of 3713 filt having a continuous substrain of 3713 filt having a continuous substrain de substrain of 3713 filt having a continuous substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substrain de substra | Assays for measuring expression of VCAM are well-known in the art and may be used or routinely modified to assess the ability of polypeptides of the invention (including ambodies and agonists or antagonists of the invention) to regulate VCAM expression. For example, FMAT                                                                   |

| Malic Enzyme, a key enzyme in<br>linoenesis Malic enzyme is           | involved in lipogenesisand its | expression is stimulted by insulin. | ME promoter contains two direct       | repeat (DR1)- like elements MEp | and MEd identified as putative PPAR | response elements. ME promoter | may also responds to AP1 and other | transcription factors. Exemplary | assays that may be used or routinely | modified to test for regulation of | transcription of Malic Enzyme (in    | hepatocytes) by polypeptides of the | invention (including antibodies and | agonists or antagonists of the     | invention) include assays disclosed | in: Streeper, R.S., et al., Mol | Endocrinol, 12(11):1778-91 (1998); | Garcia-Jimenez, C., et al., Mol | Endocrinol, 8(10):1361-9 (1994);       | Barroso, I., et al., J Biol Chem,   | 274(25):17997-8004 (1999);          | ljpenberg, A., et al., J Biol Chem,  | 272(32):20108-20117 (1997);  | Berger, et al., Gene 66:1-10 (1988); | and, Cullen, B., et al., Methods in    | Enzymol. 216:362-368 (1992), the | contents of each of which is herein | incorporated by reference in its       | entirety. Hepatocytes that may be    | used according to these assays are   | publicly available (e.g., through the | ATCCTM) and/or may be routinely | generated. Exemplary hepatocytes | that may be used according to these | assays includes the mouse 3T3-L1    |
|                                                                       |                                |                                     |                                       |                                 |                                     |                                |                                    |                                  |                                      |                                    |                                      |                                     |                                     |                                    |                                     |                                 |                                    |                                 |                                        |                                     |                                     |                                      |                              |                                      |                                        |                                  |                                     |                                        |                                      |                                      |                                       |                                 |                                  |                                     |                                     |

| HTXKF95 642 | cell line. 313-L1 is a mouse preadpooyte cell line (adhecen). It is a continuous sabarani of 313 fishoohasa developed through closul isolation. Cells indege a pre- adipooyte to adjoose-like contension under apporpiate differentiation culture conditions. | Advivation of Steletal  Massic cettal  Kinnes assays, for rightly preferred indications and standard of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the con |

HITT15 are     | an adherent epithelial cell line   | established from Syrian hamster islet  | cells transformed with SV40. These | cells express glucagon, somatostatin, | and glucocorticoid receptors. The | cells secrete insulin, which is | stimulated by glucose and glucagon | and suppressed by somatostatin or | glucocorticoids. ATTC# CRL-1777 | Refs: Lord and Ashcroft. Biochem. |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | secretion is measured by FMAT      | using anti-rat insulm antibodies.    | Insulin secretion from pancreatic beta | cells is upregulated by glucose and | also by certain proteins/peptides, and | disregulation is a key component in | diabetes. Exemplary assays that may | be used or routinely modified to test | for stimulation of insulin secretion | (from pancreatic cells) by       | polypeptides of the invention       | (including antibodies and agonists or | antagonists of the invention) include | assays disclosed in: Ahren, B., et al., | Am J Physiol, 277(4 Pt 2):R959-66 | (1999); Li, M., et al., Endocrinology, | 138(9):3735-40 (1997); Kim, K.H., | et al., FEBS Lett, 377(2):237-9 | (1995); and, Miraglia S et. al., | Journal of Biomolecular Screening, | 4:193-204 (1999), the contents of      | each of which is herein incorporated | by reference in its entirety.       | Pancreatic cells that may be used    | according to these assays are publicly | available (e.g., through the ATCCTM) | and/or may be routinely generated.     | Exemplary pancreatic cells that may | be used according to these assays | include rat INS-1 cells. INS-1 cells   | are a semi-adherent cell line        | established from cells isolated from | an X-ray induced rat transplantable | insulinoma. These cells retain | characteristics typical of native | pancreatic beta cells including | glucose inducible insulin secretion. |
|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                    |                                      |                                        |                                     |                                        |                                     |                                     |                                       |                                      |                                  |                                     |                                       |                                       |                                         |                                   |                                        |                                   |                                 |                                  |                                    |                                        |                                      |                                     |                                      |                                        |                                      |                                        |                                     |                                   |                                        |                                      |                                      |                                     |                                |                                   |                                 |                                      |

| and/or as described below under      | "Immune Activity", "Blood-Related    | Disorders", and/or "Cardiovascular | Disorders"). Highly preferred       | indications also include autoimmune | diseases (e.g., rheumatoid arthritis, | systemic lupus erythematosis,     | multiple sclerosis and/or as described | below) and immunodeficiencies (e.g., | as described below). Additional    | highly preferred indications include  | asthma. Highly preferred           | indications include neoplastic      | diseases (e.g., leukemia (e.g., acute | lymphoblastic leukemia, and acute | myelogenous leukemia), lymphoma | (c.g., non-Hodgkin"s lymphoma and     | Hodgkin"s disease), and/or as         | described below under               | "Hyperproliferative Disorders").     | Highly preferred indications include | neoplasms and cancers, such as,     | leukemia, lymphoma, melanoma, and   | prostate, breast, lung, colon,     | pancreatic, esophageal, stomach,  | brain, liver and urinary cancer. Other | preferred indications include benign    | dysproliferative disorders and pre- | neoplastic conditions, such as, for  | example, hyperplasia, metaplasia, | and/or dysplasia. Highly preferred  | indications include: suppression of   | immune reactions to transplanted    | organs and tissues (e.g., bone marrow | transplant); accelerating myeloid | recovery; and mobilizing         |
| are well known in the art and may be | used or routinely modified to assess | the ability of polypeptides of the | invention (including antibodies and | agonists or antagonists of the      | invention) to mediate                 | immunomodulation and modulate the | growth and differentiation of          | leukocytes. Exemplary assays that    | test for immunomodulatory proteins | evaluate the production of cytokines, | such as GM-CSF, and the activation | of T cells. Such assays that may be | used or routinely modified to test    | immunomodulatory activity of      | polypeptides of the invention   | (including antibodies and agonists or | antagonists of the invention) include | the assays disclosed in Miraglia et | al., J Biomolecular Screening 4:193- | 204 (1999); Rowland et al.,          | "Lymphocytes: a practical approach" | Chapter 6:138-160 (2000); and Ye et | al., J Leukoc Biol (58(2):225-233, | the contents of each of which are | herein incorporated by reference in    | its entirety. Natural killer cells that | may be used according to these      | assays are publicly available (e.g., | through the ATCCTM) or may be     | isolated using techniques disclosed | herein or otherwise known in the art. | Natural killer (NK) cells are large | granular lymphocytes that have        | cytotoxic activity but do bind    | antigen. NK cells show antibody- |

| indications include autoimmune disease (e.g., rheumatoid arthritis. | systemic lupus erythematosis,    | multiple sclerosis and/or as described | below), immunodeficiency (e.g., as | described below), boosting a T cell-  | mediated immune response, and    | suppressing a T cell-mediated       | immune response, boosting antibody-  | dependent immune responses,       | suppressing antibody-dependent  | immune responses, boosting innate   | immunity and immune responses, | and suppressing innate immunity and | immune responses. Additional    | highly preferred indications include | inflammation and inflammatory | disorders. Additional preferred     | indications include idiopathic     | pulmonary fibrosis. Highly           | preferred indications include       | neoplastic diseases (e.g., leukemia, | lymphoma, melanoma, and/or as | described below under             | "Hyperproliferative Disorders").     | Highly preferred indications include | neoplasms and cancers, such as, for | example, leukemia, lymphoma,        | melanoma, and prostate, breast, lung, | colon, pancreatic, esophageal,       | stomach, brain, liver and urinary | cancer. Other preferred indications | include benign dysproliferative       | disorders and pre-neoplastic        | conditions, such as, for example, | hyperplasia, metaplasia, and/or | dysplasia. Preferred indications |
| inflammatory activities, modulate                                   | mediate humoral or cell-mediated | immunity. Exemplary assays that        | test for immunomodulatory proteins | evaluate the production of cytokines, | such as Interferon gamma (IFNg), | and the activation of T cells. Such | assays that may be used or routinely | modified to test immunomodulatory | activity of polypeptides of the | invention (including antibodies and | agonists or antagonists of the | invention) include the assays       | disclosed in Miraglia et al., J | Biomolecular Screening 4:193-204     | (1999); Rowland et al.,       | "Lymphocytes: a practical approach" | Chapter 6:138-160 (2000); Gonzalez | et al., J Clin Lab Anal 8(5):225-233 | (1995); Billiau et al., Ann NY Acad | Sci 856:22-32 (1998); Boehm et al.,  | Annu Rev Immunol 15:749-795   | (1997), and Rheumatology (Oxford) | 38(3):214-20 (1999), the contents of | each of which are herein             | incorporated by reference in its    | entirety. Natural Killer (NK) cells | that may be used according to these   | assays are publicly available (e.g., | through the ATCCTM) or may be     | isolated using techniques disclosed | herein or otherwise known in the art. | Natural killer (NK) cells are large | granular lymphocytes that have    | cytotoxic activity but do bind  | antigen. NK cells show antibody- |
|                                                                     |                                  |                                        |                                    |                                       |                                  |                                     |                                      |                                   |                                 |                                     |                                |                                     |                                 |                                      |                               |                                     |                                    |                                      |                                     |                                      |                               |                                   |                                      |                                      |                                     |                                     |                                       |                                      |                                   |                                     |                                       |                                     |                                   |                                 |                                  |

10095] Table IE: Polynucleotides encoding polypeptides of the present invention can be used in assays to test for one or more biological activities. One such biological activity which may be tested includes the ability of polynucleotides and polypeptides of the invention to stimulate up-regulation or down-regulation of expression of particular genes and proteins. Hence, if polynucleotides and polypeptides of the present invention exhibit activity in altering particular gene and protein expression patterns, it is likely that these polynucleotides and polypeptides of the present invention may be involved in, or capable of effecting changes in, diseases associated with the altered gene and protein expression profiles. Hence, polynucleotides, polypeptides, or antibodies of the present invention could be used to treat said associated diseases.

[1096] TAQMAN® assays may be performed to assess the ability of polynucleotides (and polypeptides they encode) to alter the expression pattern of particular "target" genes. TAQMAN® reactions are performed to evaluate the ability of a test agent to induce or repress expression of specific genes in different cell types. TAQMAN® gene expression quantification assays ("TAQMAN® assays") are well known to, and routinely performed by, those of ordinary skill in the art. TAQMAN® assays are performed in a two step reverse transcription / polymerase chain reaction (RT-PCR). In the first (RT) step, cDNA is reverse transcribed from total RNA samples using random hexamer primers. In the second (PCR) step, PCR products are synthesized from the cDNA using eene specific primers.

To quantify gene expression the TAQMAN® PCR reaction exploits the 5' nuclease activity of AMPLITAQ GOLD® DNA Polymerase to cleave a TAQMAN® probe (distinct from the primers) during PCR. The TAQMAN® probe contains a reporter dye at the 5'-end of the probe and a quencher dye at the 3' end of the probe. When the probe is intact, the proximity of the reporter dye to the quencher dye results in suppression of the reporter fluorescence. During PCR, if the target of interest is present, the probe specifically anneals between the forward and reverse primer sites. AMPLITAQ GOLD® DNA Polymerase then cleaves the probe between the reporter and quencher when the probe hybridizes to the target, resulting in increased fluorescence of the reporter (see Figure 2). Accumulation of PCR products is detected directly by monitoring the increase in fluorescence of the reporter dye.

[4098] After the probe fragments are displaced from the target, polymerization of the strand continues. The 3'-end of the probe is blocked to prevent extension of the probe during PCR. This process occurs in every cycle and does not interfere with the exponential accumulation of product. The increase in fluorescence signal is detected only if the target sequence is complementary to the probe and is amplified during PCR. Because of these requirements, any nonspecific amplification is not detected.

[10099] For test sample preparation, vector controls or constructs containing the coding sequence for the gene of interest are transfected into cells, such as for example 293T cells, and supernatants collected after 48 hours. For cell treatment and RNA isolation, multiple primary human cells on human cell lines are used; such cells may include but are not limited to, Normal Human Dermal Fibroblasts, Aortic Smooth Muscle, Human Umbilical Vein Endothelial Cells, HepG2, Daudi, Jurkat, U937, Caco, and THP-1 cell lines. Cells are plated in growth media and growth is arrested by culturing without media change for 3 days, or by switching cells to low serum media and incubating overnight. Cells are treated for 1, 6, or 24 hours with either vector control supernatant or sample supernatant (or purified/partially purified protein preparations in buffer). Total RNA is isolated: for example, by using Trizol extraction or by using the Ambion

RNAqueous #-4PCR RNA isolation system. Expression levels of multiple genes are analyzed using TAQMAN®, and expression in the test sample is compared to control vector samples to identify genes induced or repressed. Each of the above described techniques are well known to, and routinely performed by, those of ordinary skill in the art.

[1010] Table 1E indicates particular disease classes and preferred indications for which polynucleotides, polypeptides, or antibodies of the present invention may be used in detecting, diagnosing, preventing, treating and/or ameliorating said diseases and disorders based on "target" gene expression patterns which may be up- or down-regulated by polynucleotides (and the encoded polypeptides) corresponding to each indicated eDNA Clone ID (shown in Table 1E, Column 2).

piol I Thus, in preferred embodiments, the present invention encompasses a method of detecting, diagnosing, preventing, treating, and/or ameliorating a disease or disorder listed in the "Disease Class" and/or "Preferred Indication" columns of Table IE; comprising administering to a patient in which such detection, diagnosis, prevention, or treatment is desired a protein, nucleic acid, or antibody of the invention (or fragment or variant thereof) in an amount effective to detect, diagnose, prevent, treat, or ameliorate the disease or disorder. The first and second columns of Table ID show the "Gene No." and "cDNA Clone ID No.", respectively, indicating certain nucleic acids and proteins (or antibodies against the same) of the invention (including polynucleotide, polypeptide, and antibody fragments or variants thereof) that may be used in detecting, diagnosing, preventing, treating, or ameliorating the disease(s) or disorder(s) indicated in the corresponding row in the "Disease Class" or "Preferred Indication" Columns of Table IE.

[0102] In another embodiment, the present invention also encompasses methods of detecting, diagnosing, preventing, treating, or ameliorating a disease or disorder listed in the "Disease Class" or "Preferred Indication" Columns of Table IE; comprising administering to a patient combinations of the proteins, nucleic acids, or antibodies of the invention (or fragments or variants thereof), sharing similar indications as shown in the corresponding rows in the "Disease Class" or "Preferred Indication" Columns of Table IE.

[1018] The "Disease Class" Column of Table 1E provides a categorized descriptive heading for diseases, disorders, and/or conditions (more fully described below) that may be detected, diagnosed, prevented, treated, or ameliorated by a protein, nucleic acid, or antibody of the invention (or fragment or variant thereof).

The "Preferred Indication" Column of Table 1E describes diseases, disorders, and/or conditions that may be detected, diagnosed, prevented, treated, or ameliorated by a protein, nucleic acid, or antibody of the invention (or fragment or variant thereof).

The "Cell Line" and "Exemplary Targets" Columns of Table 1E indicate particular cell lines and target genes, respectively, which may show altered gene expression patterns (i.e., up- or down-regulation of the indicated target gene) in TAQMAN® assays, performed as described above, utilizing polynucleotides of the cDNA Clone ID shown in the corresponding row. Alteration of expression patterns of the indicated "Exemplary Target" genes is correlated with a particular "Disease Class" and/or "Preferred Indication" as shown in the corresponding row under the respective column headings.

[0106] The "Exemplary Accessions" Column indicates GenBank Accessions (available online through the National Center for Biotechnology Information (NCBI) at www.ncbi.nlm.nih.gov/) which correspond to the "Exemplary Targets" shown in the adiacent row.

10107] The recitation of "Cancer" in the "Disease Class" Column indicates that the corresponding nucleic acid and protein, or antibody against the same, of the invention (or fragment or variant thereof) may be used for example, to detect, diagnose, prevent, treat, and/or ameliorate neoplastic diseases and/or disorders (e.g., leukemias, cancers, etc., as described below under "Hyperpoliferative Disorders").

10108] The recitation of "Immune" in the "Disease Class" column indicates that the corresponding nucleic acid and protein, or antibody against the same, of the invention (or fragment or variant thereof), may be used for example, to detect, diagnose, prevent, treat, and/or ameliorate diseases and/or disorders relating to neoplastic diseases (e.g., as described below under "Hyperpoliferative Disorders"), blood disorders (e.g., as described below under "Immune Activity" "Cardiovascular Disorders" and/or "Blood-Related Disorders"), and infections (e.g., as described below under "Infectious Disease").

The recitation of "Angiogenesis" in the "Disease Class" column indicates that the corresponding nucleic acid and protein, or antibody against the same, of the invention (or fragment or variant therof), may be used for example, to detect, diagnose, treat, prevent, and/or ameliorate diseases and/or disorders relating to neoplastic diseases (e.g., as described below under "Hyperproliferative Disorders"), diseases and/or disorders of the cardiovascular system (e.g., as described below under "Cardiovascular Disorders"), diseases and/or disorders involving cellular and genetic abnormalities (e.g., as described below under "Diseases at the Cellular Level"), diseases and/or disorders involving angiogenesis (e.g., as described below under "Anti-Angiogenesis Activity"), to promote or inhibit cell or tissue regeneration (e.g., as described below under "Regeneration"), or to promote wound healing (e.g., as described below under "Wound Healing and Enithelial Cell Proliferation").

[0110] The recitation of "Diabetes" aim the "Disease Class" column indicates that the corresponding nucleic acid and protein, or antibody against the same, of the invention (or fragment or variant thereof), may be used for example, to detect, diagnose, treat, prevent, and/or ameliorate diabetes (including diabetes mellitus types I and II), as well as diseases and/or disorders associated with, or consequential to, diabetes (e.g. as described below under "Endocrine Disorders," "Renal Disorders," and "Gastrointestinal Disorders").

| Table 1E    |                  |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                        |                      |                                                   |

| disorders involving the B-cells). Highly preferred embodiments of the invention include models of preventing, detecting, diagnosting, treating and/or ameliorating disorders of the immune system (particularly including, but not limited to, immune disorders involving B-cells). (The Dand cell line as tummen Bymphoblast cell line available through the ATCCPs as cell line number (CL-213). | Highly preferred indications include immunological disorders such as described berein mode the beading Timmune Activity and ord Bood-Related Disorders' (particularly including, but not limited to, immune disorders involving endodrial cells). Highly preferred embodimens of the investion include methods or preventing, detecting, dispossing, treating and/or ameliorating disorders of the immune system (particularly including, but not limited to, immune disorders involving endodrial and cells). (IIIVEC cells are burnan unabilisal voir endodrial cells). | Highly preferred indications include immunological disorders such as described been under the beading "Immune Activity" and/or "Blood-Related Disordes" (particularly including, but not limited to, immune disorders involving edisorders involving edisorders involving edisorders involving edisorders of the invention include ruchdods of preventing, detecting diagnosing, treating and/or ameliorating disorders of the immune system options all the properties of the immune system of particularly including, but not limited to, immune disorders involving occils of the heperic system). | Highly preferred indications include immunological disorders such as described beein under the beading "Immune Activity" and/or "Blood-Related Disordes" (particularly including, but not limited to, immune disorders involving the skin). Highly preferred embodiemens of the invention include methods of preventing, detecting, disagonsing, tenting and/or ameliorating disorders of the immune system (particularly including, but not limited of, immune disorders involving the skin). (VHIPF cells are normal human dermal fibroblass). | Highly preferred indications include immunological disorders such as described herein under the heading "Immune Activity" and of "Blood-Rained Disorders" (particularly richduling, but not limited to, immune disorders involving monocycle). Highly preferred endodiments of the invention include methods of preventing, detecting, diagnossing, treating and/or amendiorating disorders of the immune system (particularly including, but not limited to, immune disorders involving monocycles). |

| heart, lungs, circulatory system)). Highly preferred embodiments of the investion in fadde mobiles of preventing, detecting largenssing, treating and and a made a medicar medicarders of the immune system (particularly indebting, but not limited to, immune disorders involving muscle issue or the endorwascular system). (AOSMC cells are human aortic smooth muscle cells). | Highly preferred indications healthet immunological disorders such as described beein under the heading "Immune Activity" and/or "Blood-Related Disorders" (particularly including, but not limited to, immune disorders involving the cells of the gentionitestimal treat). Highly preferred embodineans of the invention include methods of preventing, detecting, dispossing, treating and/or ameliorating disorders of the immune system (particularly including, but not limited to, immune disorders involving cells of the gestooine-stimal tract). (The Gao-2 cell line is a human obsorbed all advosancement and activities and the ATRCPA as cell intenument 1917). | Highly preferred indications include immunological absorbers such as<br>described been under the bending "limmune Activity" and/or "Bland-<br>Related Disorders" (particularly including, but not limited to, immune<br>disorders involving the Secials. Highly preferred tenocholimens of the<br>invention include methods of preventing, detecting, diagnossing, treating<br>and/or ameliorating disorders of the immune system (particularly<br>including, but not limited to, immune disorders involving extectle). The<br>Dand cell line is a human B tymphoblast cell line available through the<br>ATCCPA as cell line number CCL-213). | Highly preferred indications include immunological disorders such as described beein under the bealing Himmun Activity's andor "Blood-Related Disorders" (particularly including, but not limited to, immune disorders involving the T-cells). Highly preferred embodiments of the invention include methods of preventing, detecting, diagnosing, treating andors ameliocating disorders of the immune system (particularly). |
